

## – HTML and CSS

You are given the file Exercise2.html which creates the home page for Jake's Coffee Shop website. This displays as shown in figure 1.

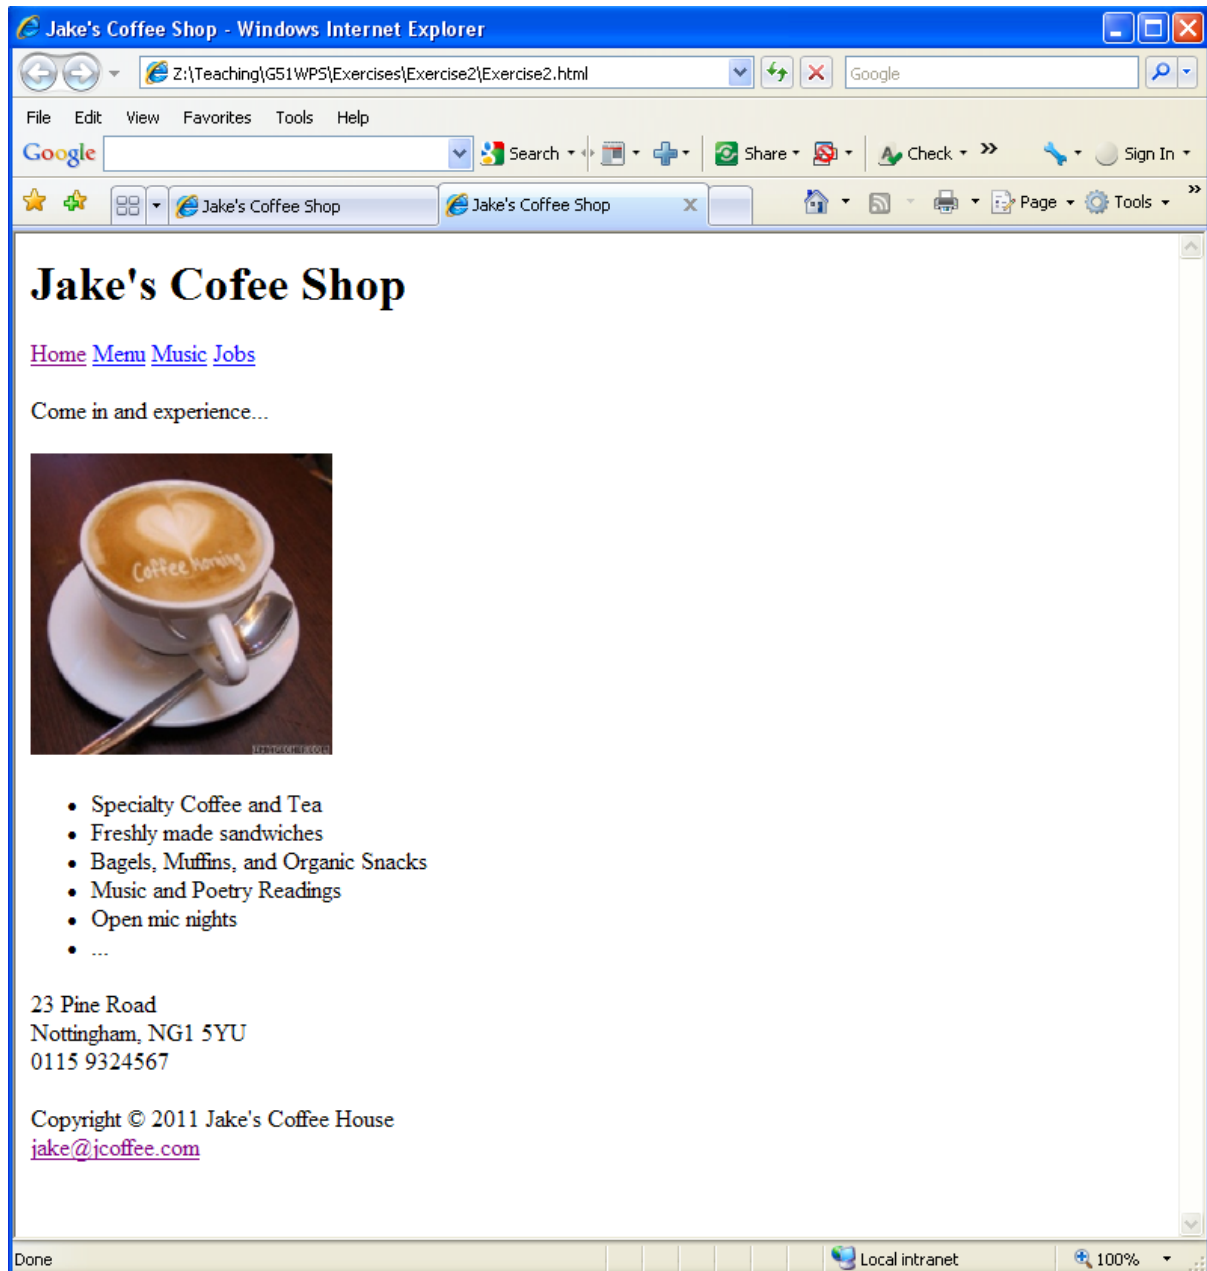

Figure 1. Display of original HTML file

Write the appropriate CSS to change the presentation of the webpage to that shown in figure 2. The new page layout includes a header section, two columns (one for navigation menu and one for the main content) and a footer section.

**Figure 2. Display of Exercise2.html with CSS**

The colours used are as follows:

Text: #330000

Body background: #ffffcc

Header and footer background: #ccaa66

Left (navigation) column background: #E8D882

Right (main content) column background: #f1e8b0

The text is displayed in Verdana font.

You should write an external CSS file. You need to modify the original HTML file only to link to this style sheet, mark up sections (using `<div>` tags) and set appropriate `class` and `id` attributes.

**Note:** you can use any editor you like to modify the html file and to create your CSS file (Notepad++ in the labs is a good choice). Just make sure that you save your files as plain text and that you give the stylesheet a .css extension.
